

The Infant of Divorce: Applying a Developmental Lens to the Risks & Possibilities of Parental Separation - Video

Price: \$29.00

Description

" Dr. Jennifer McIntosh's presentation focuses on the parenting of infants after separation, one of the most complex and emotionally charged debates in the history of family law. McIntosh considers the policy, advocacy, research, theory and practice micro-climates that clash, and merge to create the perfect storm around the infant of divorce and separation. The questions: Can neuro-science help inform the policy climates which impact the lives of infants in divorce, and guide legal decision making about the infant, toward developmentally sound parenting arrangements? Can neurodevelopmental perspectives support parents to make more effective transitions to co-parenting, after separation? Perspectives from inter-personal neurobiology and current research findings from divorce specific studies are brought to bear on these questions. New approaches to theoretical integration are outlined, new interventions described, and the future of preventative work considered. This presentation includes intermediate and advanced continuing education for clinicians, social workers, counselors, MFTs, LCSWs, psychotherapists and other mental health practitioners. {audio} The Infant of Divorce - Applying a Developmental Lens to the Risks and Possibilities of Parental Separation
